Outline

Outline

Abstract

- I just want to solve SDP very very accurately!
- Problems from chemistry can be solved via SDP solvers:
  [Nakata-Nakatsuji-Ehara-Fukuda-Nakata-Fujisawa, J. Chem. Phys. 114, 8282 (2001)]
- Such problems require very high accuracy to SDP; relative gap $< 1.0 \times 10^{-8}$
- There are some inaccurate results.
- Multiple precision arithmetic version of SDPA; SDPA-GMP, SDPA-QD, SDPA-DD: http://sdpa.indsys.chuo-u.ac.jp/sdpa/.
- Multiple precision arithmetic version of BLAS/LAPACK: mpack http://mplapack.sourceforge.net/
- YES we can solve very very accurately!

Outline

What is number?

There are several kinds of numbers.

- Natural number: $0, 1, 2, 3, 4, \cdots$
- Integer: $\cdots, -3, -2, -1, 0, 1, 2, 3, 4, \cdots$
- Rational number: a/b, where a, b are relatively prime
- Real number: convergence of Cauchy series.
  $\{x_n : x_n \in \mathbb{Q}\}_{n=0,1\cdots}$ s.t. $\forall \epsilon > 0, \exists N, \forall n, m > N \rightarrow |x_n - x_m| < \epsilon$ defines a real number x.
- Complex number: $z = a + bi$: two real numbers with i.
- floating point number: designed for computers, subset of rational numbers.

What is number?

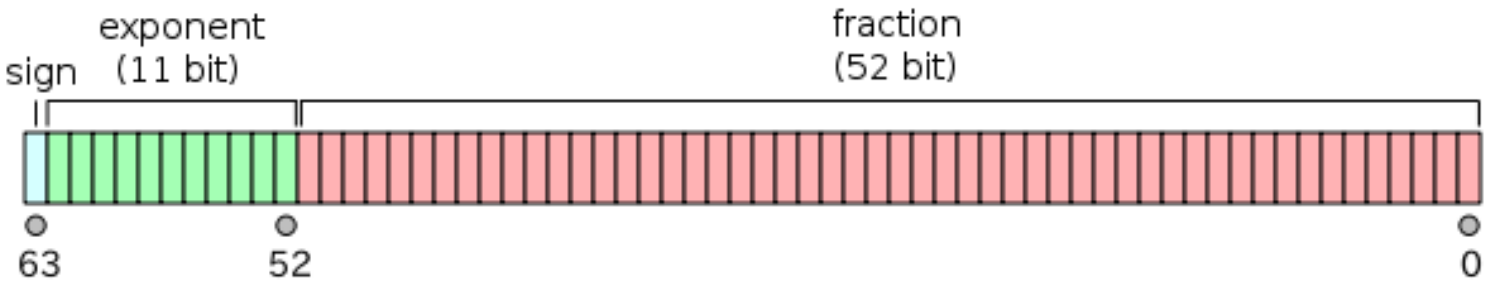
IEEE 754: Standard for Binary Floating-Point Arithmetic

- The IEEE Standard for Floating-Point Arithmetic (IEEE 754) is the most widely-used standard for floating-point computation.
- Very well designed we feel as if we treat real numbers.
- IEEE 754 double is expressed in 64-bit (= 8 bytes)



- $a = \pm\left(\frac{1}{2} + \frac{d_2}{2^2} + \frac{d_3}{2^3} + \cdots + \frac{d_{52}}{2^{52}}\right) \times 2^e$, $d = 0$ or 1, $e = -1022 \sim 1023$
- about 16 significant digits ($\log_{10} 2^{53} = 15.955$).
- Implemented for popular CPUs.

IEEE 754: Standard for Binary Floating-Point Arithmetic

- Arithmetic operations with rounding errors.

$$A \oplus B \neq A + B$$

  Almost every manipulation include rounding error.

- In this study, still we suffer from the rounding error. We just add precision.

IEEE 754: Standard for Binary Floating-Point Arithmetic

Outline

Semidefinite programming

$$
\begin{cases}
\text{primal} \quad \text{minimize:} & A_0 \bullet X \\
\qquad\qquad \text{s.t.:} & A_i \bullet X = b_i \qquad (i = 1, 2, \cdots, m) \\
& X \succeq 0 \\
\text{dual} \quad \text{maximize:} & \displaystyle\sum_{i=1}^{m} b_i z_i \\
\qquad\qquad \text{s.t.:} & \displaystyle\sum_{i=1}^{m} A_i z_i + Y = A_0 \\
& Y \succeq 0
\end{cases}
$$

A_i is $n \times n$ real symmetric matrices, X $n \times n$ real symmetric variable matrix, b_i are constant vectors of m-dimension, Y is $n \times n$ a real symmetric variable matrix, $X \bullet Y := \sum X_{ij} Y_{ij}$. $X \succeq 0$ means X is positive semidefinite.

Outline

Do we need to solve SDP problems *accurately?*

There are some questions for SDP results.

- Some SDPs are hard to solve. The results may have large gaps, not feasible.
- Simply we may not trust the results: “Strange Behaviors of Interior-point Methods for Solving Semidefinite Programming Problems in Polynomial Optimization” [Waki-Nakata-Muramatsu submitted]
- Users seldom care about the input file: try to solve ill-posed SDPs.

Outline

Sources of the evil (I)

- IEEE 754 double arithmetic: done in 16 significant digits. accuracy losses in manipulations

$$1 \oplus 1.0 \times 10^{-17} = 1$$

- Condition number of matrix A; $||A||||A^{-1}||$. when it becomes 10^{16}, solution to the linear equation is inaccurate with IEEE 754 double.
- $X \bullet Y = 0$ at the optimum (complementarity slackness theorem for SDP)
  variable matrix becomes singular at the optimum; condition number becomes infinite!

Sources of the evil (I)

- IEEE 754 double arithmetic: done in 16 significant digits. accuracy losses in manipulations

$$1 \oplus 1.0 \times 10^{-17} = 1$$

- Condition number of matrix A; $\|A\|\|A^{-1}\|$. when it becomes 10^{16}, solution to the linear equation is inaccurate with IEEE 754 double.
- $X \bullet Y = 0$ at the optimum (complementarity slackness theorem for SDP)
  variable matrix becomes singular at the optimum; condition number becomes infinite!

  variable matrix becomes singular at the optimum; condition number becomes infinite!

Sources of the evil (II)

- Z^{-1}: Primal-dual interior point method calculates Z^{-1}; *"It is seldom necessary to compute the inverts of matrix explicitly, and it is certainly not recommended as a means of solving linear systems."* by LAPACK Users' Guide Third Edition, p.14.
- Human factor: users try to solve SDPs which do not satisfy Slater's condition, i.e., *no interior points* etc, NO GUARANTEE! DO NOT BLAME SOLVERS!

A brute force method for accurate SDP solutions

- Use multiple precision arithmetic; GMP, QD rather than IEEE 754 double.
- Simple answer to obtain high accuracy.
- Do not solve all the problems, but many!

A brute force method for accurate SDP solutions

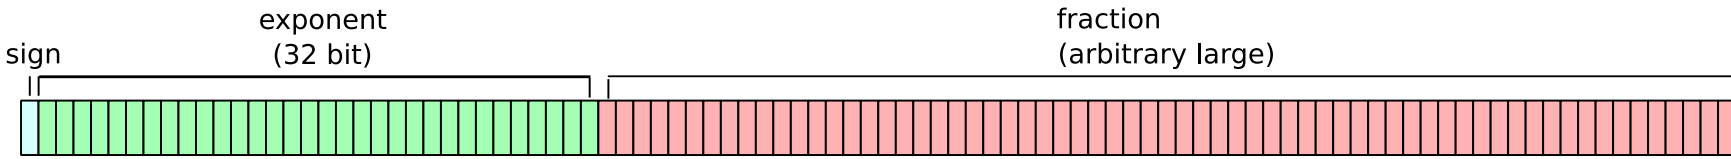
- Use multiple precision arithmetic; GMP, QD rather than IEEE 754 double.
- Simple answer to obtain high accuracy.
- Do not solve all the problems, but many!

A brute force method for accurate SDP solutions

- Use multiple precision arithmetic; GMP, QD rather than IEEE 754 double.
- Simple answer to obtain high accuracy.
- Do not solve all the problems, but many!

What is GMP?

- GMP is a free library for arbitrary precision arithmetic, operating on signed integers, rational numbers, and floating point numbers.
- significant digits: arbitrary (I usually use $60 \sim 72$ digits)



Strategy and features

- Using existing multiple precision libraries.
- Based on SDPA; http://sdpa.indsys.chuo-u.ac.jp/sdpa/
- No changes in algorithm.
- Changes from SDPA should be minimal to reduce the maintenance cost.
- Matrix-vector manipulations and eigenvalues etc. → Multiple precision version of LAPACK and BLAS.
  - 49 routines from MPACK; Rpotrf (dpotrf.f; cholesky), Rsyev (dsyev.f eigenvalue), Rsterf, Rsteqr (dsterf.f, dsteqr.f) etc..
- Introduction of "precision" parameter; controls number of significant bits used in the calculations.
- Actually I did was replacing "double" to "mpf_class" carefully.

Another MP library: Quad-Double library

- Usually quadruple or octuple precision are enough.
- Double-Double and Quad-Double Arithmetic; by Y. Hida, Xiaoye S. Li, David H Bailey, and faster than GMP.
- Four/two unevaluated IEEE 754 double $\sim$ approx octuple/quadruple precision.

$$A = (a_0, a_1, a_2, a_3)$$

- Utilize exact transformations [Dekker, Knuth, Priest, Shewcheck].

$$a = x \oplus y, b = x + y - (x \oplus y)$$

  Error by IEEE754 add $x \oplus y$ can be *exactly* evaluated.
- Replace “mpf_class” to “dd_real” and “qd_real” $\rightarrow$ SDPA-QD, SDPA-DD.

What is MPACK?

- MPACK is a multiple precision version of BLAS and LAPACK. http://mplapack.sourceforge.net/
- What is the BLAS? The BLAS (Basic Linear Algebra Subprograms) are routines that provide standard building blocks for performing basic vector and matrix operations.
- What is LAPACK? This provides routines for solving systems of simultaneous linear equations, least-squares solutions of linear systems of equations, eigenvalue problems, and singular value problems.
- Written C++, but look very similar to reference BLAS implementation.
- Very portable and no optimization at this moment.
- Pretty good compatibility with BLAS and LAPACK.

```

How MBLAS is used in SDPA-GMP?

From sdpa_linear.cpp from SDPA-GMP 7.1.2.

```
    if (scalar==NULL) {
      scalar = &MONE;
      // scalar is local variable
    }
    // The Point is the first argument is "Transpose".
    Rgemm("Transpose","NoTranspose",retMat.nRow,retMat.nCol,aMat.nCol,
          *scalar,aMat.de_ele,aMat.nCol,bMat.de_ele,bMat.nRow,
          0.0,retMat.de_ele,retMat.nRow);
    break;
  case DenseMatrix::COMPLETION:
    rError("no support for COMPLETION");
    break;
  }

  return _SUCCESS;
```

History

- YAMASHITA-san told me NAKATA Kazuhide-san's student implemented MP version of SDP solver in Java using fixed point numbers.
- I started to implement SDPA-GMP6 based on SDPA6. The first working version: 2006/12/5. Lot of discussions with NAKATA Kazuhide-san.
- First appearance of SDPA-GMP 6 is Journal of chemical physics 128, 16 164113 (2008); to solve strong correlation limit of Hubbard model.
- I have been implementing general purpose multiple precision version of BLAS/LAPACK routines; MPACK (MBLAS/MLAPACK).
- SDPA-GMP 6, 7.0.2, 3, 5 etc. internal versions.
- SDPA-GMP 7.1.0 has been released in 2008/4/10.
- MPACK (MBLAS/MLAPACK) 0.0.8 has been released in 2009/1/8.
- SDPA-GMP 7.1.2 supports MPACK 0.0.9 in 2009/2/5.
- QD and DD version are requested by Hans D. Mittelmann and Fujisawa-san.
- SDPA-GMP, QD and DD 7.1.2 have been released in 2009/3/21.
- SDPA-GMP, QD and DD is on NEOS server
- Extensive tests with Waki-san and Fujisawa-san.

Summary

- We developed multiple precision version of SDP solver. SDPA-GMP, SDPA-QD and SDPA-DD.
- Can solve SDPs very accurately.
- MPACK 0.0.9: Multiple precision version of LAPACK/BLAS: development ongoing.

- Outlook
  - Faster SDPA-GMP, QD, DD and MPACK, parallel and multicore versions.
  - More routines for MPACK.
  - Higher accuracy to SDPA; minimal use of multiple precision arithmetic.
